**Key:**

- 1 Data is reported as: % susceptible (# isolates tested) - not all bacteria isolated at ISU VDL have been tested for antimicrobial susceptibility  
2 See *Salmonella* serotype table for most common serotypes isolated within each group  
3 Isolates resistant to oxacillin are interpreted as potentially methicillin resistant.  
4 A result of <=2 ug/ml for Carbadox is a conservative indicator of bacterial inhibition by this antimicrobial agent. The result shown is based on pharmacokinetic research indicating an average Carbadox level of 4.5 mcg/ml in the small intestine of pigs fed a dose rate of 50 g/ton. (De Graff 1988).  
5 Multidrug resistant isolates were found resistant to most classes of antimicrobial in the 1<sup>st</sup> round of testing. This table represents additional Disk Diffusion testing for those isolates.
